[A Summary of Manual and Mechanical Ability Tests](#) May 29 2022 "This summary represents an early draft of a report on tests of manual and mechanical abilities. In more normal times publication would have been deferred until the editorial work had been completed. The delay that would have been necessary because of the preoccupation of both authors with war work and the interest expressed by psychologists have led us to this present and perhaps premature publication"--Foreword. [Howard Andrew Knox](#) Dec 24 2021 Howard Andrew Knox (1885–1949) served as assistant surgeon at Ellis Island during the 1910s, administering a range of verbal and nonverbal tests to determine the mental capacity of potential immigrants. An early proponent of nonverbal intelligence testing (largely through the use of formboards and picture puzzles), Knox developed an evaluative approach that today informs the techniques of practitioners and researchers. Whether adapted to measure intelligence and performance in children, military recruits, neurological and psychiatric patients, or the average job applicant, Knox's pioneering methods are part of contemporary psychological practice and deserve in-depth investigation. Completing the first biography of this unjustly overlooked figure, John T. E. Richardson, former president of the International Society for the History of the Neurosciences, takes stock of Knox's understanding of intelligence and his legacy beyond Ellis Island. Consulting published and unpublished sources, Richardson establishes a chronology of Knox's life, including details of his medical training and his time as a physician for the U.S. Army. He describes the conditions that gave rise to intelligence testing, including the public's concern that the United States was opening its doors to the mentally unfit. He then recounts the development of intelligence tests by Knox and his colleagues and the widely-discussed publication of their research. Their work presents a useful and extremely human portrait of psychological testing and its limits, particularly the predicament of the people examined at Ellis Island. Richardson concludes with the development of Knox's work in later decades and its changing application in conjunction with modern psychological theory.

[The Witmer Formboard and Cylinders as Tests for Children Two to Six Years of Age \(Classic Reprint\)](#) Sep 20 2021 Excerpt from The Witmer Formboard and Cylinders as Tests for Children Two to Six Years of Age The Witmer formboard and cylinders have been used for several years in the Psychological Clinic of the University of Pennsylvania as a means for measuring the abilities Of children. Since no one knew how the ordinary child performed the test nor in how many seconds he could do it, comparisons were always made between children of like age who had appeared at the Clinic. In 1915, Dr. Herman H. Young Obtained formboard records from a large number of normal children of school age in the public schools Of Philadelphia, and a similar investigation for the cylinders has recently been made by Dr. Franklin C. Paschal. Not enough records have yet been col lected for the standardization of either test, but a start in that direction has been made. Many children of less than six years are brought to the Clinic for examination. The use of either of these tests as testing or teaching material is Of doubtful value if no one knows what is to be expected Of normal Children of from two to six years Of age. The Clinic has held consistently that the child of four years should be able to do the formboard correctly, and the child of six years, the cylinders, but this view came as a result of clinical experience and not from the records of a large number Of normal children. Through a study of records Of normal children of kindergarten age or younger the present investigation aims to determine. [Psychological Testing in the Service of Disability Determination](#) Aug 20 2021 The United States Social Security Administration (SSA) administers two disability programs: Social Security Disability Insurance (SSDI), for disabled individuals, and their dependent family members, who have worked and contributed to the Social Security trust funds, and Supplemental Security Income (SSI), which is a means-tested program based on income and financial assets for adults aged 65 years or older and disabled adults and children. Both programs require that claimants have a disability and meet specific medical criteria in order to qualify for benefits. SSA establishes the presence of a medically-determined impairment in individuals with mental disorders other than intellectual disability through the use of standard diagnostic criteria, which include symptoms and signs. These impairments are established largely on reports of signs and symptoms of impairment and functional limitation. Psychological Testing in the Service of Disability Determination considers the use of psychological tests in evaluating disability claims submitted to the SSA. This report critically reviews selected psychological tests, including symptom validity tests, that could contribute to SSA disability determinations. The report discusses the possible uses of such tests and their contribution to disability determinations. Psychological Testing in the Service of Disability Determination discusses testing norms, qualifications for administration of tests, administration of tests, and reporting results. The recommendations of this report will help SSA improve the consistency and accuracy of disability determination in certain cases.
